Objective:

Motivated and detail-oriented Software Developer with strong foundations in computer science, programming, and problem-solving. Skilled in designing, developing, and optimizing applications using modern technologies. Seeking to contribute to innovative projects at Google through an internship opportunity, while enhancing expertise in scalable systems, algorithms, and collaborative development.

Technical Skills:

Programming Languages:	Python, Java, C, C++, JavaScript, HTML, CSS, .NET
Databases:	MySQL, MongoDB
Version Control & Tools:	Git, GitHub
Cloud Technologies:	AWS Cognito
Software Development Concepts:	Data Structures & Algorithms, Object-Oriented Programming, REST APIs, Testing & Debugging

Soft Skills:

- **Relationship Building:** Able to establish and cultivate strong working relationships with stakeholders, fostering effective collaboration and communication.
- **Team Collaboration:** Excel in interdisciplinary team environments, leveraging diverse perspectives to achieve common goals.
- **Quick Adaptability:** Rapidly embrace new technologies and methodologies, ensuring seamless integration into dynamic work environments.
- **Analytical Thinking:** Possess a meticulous approach to problem-solving, dissecting complex issues and formulating well-structured solutions.

Personal Project:

Scheduled Trade Execution System (Call-side) – .NET & Shoonya API

- Designed and implemented an automated trading system that executes daily call-side trades at 10:00 AM using the Shoonya brokerage API.
- Built in .NET with secure authentication, error handling, and API-based order placement.
- Automated scheduling reduced manual intervention and improved trade consistency and accuracy.

Projects:

Distance Measurement using Ultrasonic Sensor

- Designed and implemented a system to measure distance by interfacing an ultrasonic sensor with a microcontroller (e.g., Arduino).
- Developed embedded C/Arduino code to calculate distance based on time-of-flight of ultrasonic waves.
- Displayed measured distance on an LCD/serial monitor for real-time feedback.
- Applied concepts of sensors, signal processing, and microcontroller programming.

Named Entity Recognition (NER) – Mini Project

- Implemented a Natural Language Processing (NLP) model to identify and classify named entities such as person names, organizations, locations, and dates.
- Utilized **Python, NLTK/spaCy, scikit-learn** for text preprocessing, tokenization, and entity extraction.
- Trained and evaluated the model using labeled datasets to improve accuracy in entity classification.
- Gained hands-on experience in **NLP pipelines, machine learning, and text analytics**.

Autonomous Road Condition Monitoring via UAV and Deep Learning

- Designed a system to detect and classify road surface conditions using **Unmanned Aerial Vehicles (UAVs)** equipped with high-resolution cameras.
- Applied **Deep Learning (CNNs)** for image analysis to identify potholes, cracks, and road damage in real time.
- Developed a pipeline for **data collection, preprocessing, model training, and deployment**.
- Improved accuracy of detection by leveraging **TensorFlow/Keras and OpenCV**.
- Demonstrated applications in **smart city infrastructure and intelligent transportation systems**.

Education:

B.Tech–ComputerScience&Engineering | VMGE | *Jun-2025*

12th–NarayanaJuniorCollege | *Jun-2021*

10th – Sri Chaitanya Techno School | *Jun-2019*

Training & Certifications:

- Python fullstack with AI
- Jupyter for Data Science in Infosys springboard.

Personal Information:

Location: India

Relocation: Open to relocation for internship opportunities
